I recently received a mailing from Eversource about a rate increase proposal. Included in the packet was an incomprehensible list of standard rates and proposed rates for various types of usage. It lists things like Residential electric heat, Small Electric Vehicle charging, Medium electric vehicle charging etc. As far as I know, Eversource has no information on whether my house has electric heat (it doesn't) and whether I am charging an electric car (I am) and what size electric car it is. In fact, size of the electric vehicle would seem irrelevant since you pay for Wh of power, which could be a small amount or large amount depending on how discharged the battery is and how much you charge it. They also list a bunch of "Tiers" with no explanation of what that refers to. Can you clarify any of this?

My comment on the rate increase is that one would think that a company that has gone from producing all the energy for the state to now getting free energy from rooftop solar on a large scale would presumably need to produce much less power than in the past. That would naively make the cost of producing energy for the state go down, since individuals are paying for the solar panels. I have seen no information on power production and power needs and how much residential solar is impacting costs. I would also argue that a company that produces a necessary utility product for all state residents should be a non-profit, not out for profits. Sincerely, David
