# Electronic Transmittal Form for DEEP Remediation, LUST, and PCB Secure File Transfer (SFT)

DEPARTMENT OF ENERGY AND ENVIRONMENTAL PROTECTION
REMEDIATION DIVISION, PCB PROGRAM, AND
LEAKING UNDERGROUND STORAGE TANK COORDINATION PROGRAM
www.ct.gov/deep

This Electronic Transmittal Form must be completed and included as the cover sheet of your electronic document when uploading a document to the Connecticut SFT website. Requirements for Transmittals through the SFT website:

- Documents submitted through the SFT website must include all applicable figures, tables and laboratory data.
- Files must be formatted as PDF/A and use the appropriate naming convention:
  - For Remediation Filings: **REM_REMID #_SiteAddress_Town_DocumentType_DateofDocument**
  - For LUST Filings: **LUST_SiteAddress_Town_AbbreviationForDocumentType_DateofDocument**
  - For PCB Filings: **PCB_SiteAddress_Town_AbbreviationForDocumentType_DateofDocument**
  **Example:** LUST_1MainStreet_Hartford_ESA_01-01-2001
  **Note:** For "AbbreviationForDocumentType" use appropriate abbreviation at Transmittal of Documents
- If no Rem ID assigned (new filing) or REM ID is unknown leave field blank

**Part I: Primary Recipient*: LUST Program** (* required)

| For Remediation documents: | For PCB/LUST documents: |
|---|---|
| Primary Program*: Select a Program | UST Facility ID: 170-8475 (if applicable) |
| Rem ID*: | Spill Case Number: 1989-03058 (if known) |

**Part II: Site Information**

Site Name*: Madison Area Work Center, aka "Madison Regional Service Center"
Site Address*: 135 New Road
City/Town*: Madison State: CT Zip Code: 06443

Secondary Programs (complete as many as applicable for this document):

Appendix A – Public Notice

# 1 Introduction

Groundwater & Environmental Services, Inc. (GES), on behalf of Eversource Energy Service Company (Eversource), has prepared this *Remedial Action Plan* (RAP) for the Madison Area Work Center (AWC) located at 135 New Road, Madison, Connecticut (the Site). The Madison AWC is listed in the Connecticut Department of Energy and Environmental Protection (CTDEEP) database of potentially contaminated properties as a Leaking Underground Storage Tank (LUST) site, LUST ID # 31668.

A Site Location Map depicting the site and local area is included as **Figure 1**.

## 1.1 Purpose

The purpose of this RAP is to summarize the remedial technology selected to address gasoline impacts associated with historical release(s) from the USTs. An evaluation of potential remedial technologies for the Site was previously summarized in the December 8, 2020 *Remedial Strategy Opinion* prepared by GES. The selected remedial technology must be capable of reducing contaminant concentrations in soil and groundwater to levels that comply with the Connecticut Department of Energy and Environmental Protection (CTDEEP) Remediation Standard Regulations (RSRs) numeric criteria. The extent of the impacts was described in the 2022 *Supplemental Subsurface Investigation Report* prepared by GES.

## 1.2 Regulatory Status

The Remediation Standard Regulations (RSRs), Sections 22a-133k-1 – 22a-133k-3 of the Regulations of Connecticut State Agencies apply to any action taken to remediate polluted soil, surface water or groundwater at or emanating from a release area where action is required by law or order of the Commissioner. The Site is subject to Connecticut's Underground Storage Tank (UST) regulations, which require remediation of releases of regulated substances, including petroleum products, to soil and groundwater. The RSR criteria that pertain to the remediation of soil include the GA Pollutant Mobility Criteria (GA PMC) and Residential Direct Exposure Criteria (RDEC).

Eversource continues to operate a groundwater recovery and treatment system and to conduct annual groundwater monitoring activities at the Site. Eversource submits monthly discharge monitoring reports and annual groundwater monitoring reports to CTDEEP detailing the ongoing operation of the remedial system and groundwater monitoring results.

# 2 Environmental Setting

## 2.1 Site Description and Use

The Site is located to the north of New Road and approximately 0.25-miles northwest of Interstate 95 in an area of mixed industrial and residential use. The Site is situated on a parcel of land that totals 37.98 acres and is currently owned by The Connecticut Light and Power Company dba

Eversource Energy. Eversource utilizes the Site as an area work center, which serves as a staging area for service trucks and supplies for electric distribution in the area. Current improvements/operations include office space, a service garage for fleet trucks, a utility pole storage area, a transformer storage area (new and used transformers), a storage area for cable supplies for electric distribution, parking areas, and lawn. The office space is occupied by Eversource and by Colliers International, a real estate management services company.

Site operations historically included service truck refueling activities that ceased in 1993 with the removal of the USTs. A remediation system, consisting of four recovery wells (RW-1 through RW-4), an air stripper, granular activated carbon, and an infiltration gallery for groundwater reinjection was installed in 1991 and remains in operation. A Site map depicting the site layout and pertinent Site features is included as **Figure 2**.

## 2.2 Physical Setting

### 2.2.1 Topography

According to the USGS *7.5-Minute Series Topographic Quadrangle for Clinton, Connecticut* (USGS, 1984) included as **Figure 1**, the Site is located at approximately 55 feet above mean sea level. Based on Site reconnaissance observations, topography at the Site slopes gently to the southeast towards New Road.

### 2.2.2 Surface Water

Based on the South-Central Regional Council of Governments (SCRCOG) online regional Geographic Information System (GIS) resources (accessed March 9, 2021), there are no observed surface water bodies located on the Site. The closest surface water body is an unnamed wetland located approximately 260 feet south of the Site.

Within an approximate 0.5-mile (2,640 feet) radius of the Site, the following surface water bodies and wetlands were identified:

- Wetlands located approximately 260 feet south
- Hammonasset River located approximately 1,560 feet northeast
- Fence Creek located approximately 1,590 feet west
- Hummers Pond located approximately 2,380 feet southwest
- Horse Pond located approximately 2,640 feet northwest
- Various wetlands located to the northwest, northeast, east, southwest and west

According to the National Flood Insurance Program (NFIP) Flood Insurance Rate Map (FIRM) Panel 0512J for New Haven County, Connecticut, the Site is not located within a special flood hazard area (SFHA) subject to inundation by the 1% annual chance flood.

### 2.2.3 Groundwater Classification

According to the Water Quality Classifications Map Madison, CT (CTDEEP 2018), the Site is located in a "GA" area and partially located within a final aquifer protection area (Level A), where groundwater is classified as "GA" and where CTDEEP anticipates reclassifying the groundwater as "GAA" in the future. Designated uses for groundwater classified as GA include existing private and potential public or private supplies of water suitable for drinking without treatment, and baseflow for hydraulically connected surface water bodies. The GAA groundwater classification is designated for use as existing or potential public water supply suitable for drinking without treatment and baseflow for hydraulically connected surface water bodies. A final aquifer protection area contributes groundwater to active public water supply wells or well fields that serve more than 1,000 people and are set in sand and gravel aquifers.

### 2.2.4 Geology

According to the *Surficial Materials Map of Connecticut* (Stone et al., 1992), the Site is situated at the boundary of two surficial geologic units. This first unit is described as a sand unit composed of coarse to fine sands, commonly occurring in well-sorted layers. The coarse layers may contain granule to pebble size gravel; the fine layers may consist of the fine sands, silts, and clays associated with delta foreset beds, distal fluvial deposits, and/or windblown sediment. The second unit is described as a thin till, generally 10-15 feet thick, which can contain a looser, coarser-grained ablation till, a denser, finer-grained lodgement till, or both.

Surficial geology at the Site has been investigated and described by several consultants, including Geologic Company, Leggette, Brashears, & Graham, Inc. (LBG), and Weston & Sampson. The boring logs prepared by Geologic Company and LBG describe the presence of glacial till to a depth of approximately 15 feet below grade (fbg). Soil descriptions from the three companies are generally consistent with the ablation till unit described by Stone et al. (1992), with the exception that Geologic Company reported the presence of cobbles in many of the boring locations. LBG's 1990 recovery well and monitoring well logs indicated the till described in different locations as clay and fine sand or sand and gravel. These logs also describe small-scale layering in several of the borings. The blow counts recorded on the boring logs prepared by Geologic Company and LBG, and the layering described in LBG's logs, support the conclusion that the ablation till is the predominant surficial geologic unit at the Site.

According to the *Bedrock Geologic Map of Connecticut* (Rogers, 1985), the bedrock underlying the Site is the Waterford Group, a light to dark medium-grained gneiss.

Based on the findings of the 2019 and 2021 subsurface investigations performed by GES, and historical Site findings, overburden soils within the investigation areas are present at depths ranging from 8-18 fbg with bedrock encountered at approximately 14-15 fbg. During the 2021 supplemental subsurface investigation, weathered bedrock was observed at bedrock well locations BR-1 and BR-2 at approximately 18 to 33 fbg (BR-1) and 14 to 27 fbg (BR-2). Competent bedrock was observed at 33 fbg (BR-1) and 27 fbg (BR-2).

### 2.2.5 Hydrogeology

Overburden groundwater flow is interpreted to be to the south with a hydraulic gradient of approximately 0.031 to 0.034 feet per foot (ft/ft). Depth to groundwater varies across the Site with seasonal fluctuations of approximately 2 feet. Water table interpretations are defined by two areas, utilizing monitoring well MW-13 as the benchmark.

- In overburden monitoring wells north of well MW-13, the seasonal high and low water table averages between 9.5 and 11.5 fbg, respectively. The saturated zone is at depths greater than 11.5 fbg.
- In overburden monitoring wells south of well MW-13, the seasonal high and low water table averages between 12.5 and 14.5 fbg, respectively. The saturated zone is at depths greater than 14.5 fbg.

# 3 Site Background

## 3.1 Description of Release

Petroleum constituents are present in soil and groundwater at the Site due to a release(s) from historical USTs that were formerly utilized for refueling fleet vehicles. A release from the UST system was first identified during a soil gas survey and monitoring well installation and sampling event completed in August 1989. Impacted soil was encountered during excavation along the vent line of the 10,000-gallon unleaded gasoline UST E5 on August 29, 1989. An excavation along the end of UST E5 revealed evidence of a release under the UST. The release was reported to CTDEEP and spill #1989-03058 and LUST ID #31668 were assigned to the Site. Removal of UST E5 and excavation of surrounding soil was conducted on August 31, 1989. Additional information related to the volume of soil removed, remaining soil quality, or regulatory involvement was not reported.

## 3.2 Previous Remedial Activities

The groundwater recovery and treatment system currently operating at the Site was installed in 1991. Between 1992 and 1998, a soil venting and portable air sparging system was operated at select wells to reduce the adsorbed-phase and dissolved-phase impacts associated with monitoring wells outside of the recovery well network. According to the January 1999 *Status Report* prepared by Northeast Utilities Service Company (a predecessor Eversource company), the sparge/vent system removed 410 gallons of gasoline throughout its operation. The system was deactivated for the winter on October 20, 1998, and due to low vapor-phase recovery was ultimately removed from the Site.

# 4 Remedial Goals

As indicated in Section 1.1 above, the selected remedial technology must be capable of reducing contaminant concentrations in soil and groundwater to levels that comply with RSR numeric criteria. Based on groundwater quality data collected to date, GES anticipates that remediation of

source soils in the gasoline release area will result in a sufficient reduction in dissolved-phase contaminant concentrations such that active groundwater remediation will not be required to achieve compliance with the applicable RSR criteria.

# 5 Remedial Technology Options

In order to identify the most expeditious approach to bring the Site into compliance with the RSRs, an initial screening of remedial technologies was completed and documented in the *Remedial Strategy Opinion* (GES, December 20, 2020). The remedial technologies evaluated capable of addressing adsorbed- and dissolved-phase hydrocarbons include:

- Soil Vapor Extraction (SVE)
- SVE and Air Sparge (AS)
- In-Situ Chemical Oxidation
- Groundwater Recovery and Treatment
- Soil Excavation

A general description of the remedial alternatives that were screened as potentially applicable alternatives, along with their salient advantages and disadvantages, are presented in the following sections.

## 5.1 Soil Vapor Extraction

Active remediation utilizing SVE technology is designed for in-situ remediation to remove and treat volatile organic compounds (VOCs) in the vadose zone. The SVE system utilizes a blower to apply a vacuum at extraction wells, allowing for the recovery of soil vapors from unsaturated soils. As air moves through contaminated vadose zone soils, VOCs, including adsorbed-phase hydrocarbons, volatilize into the vapor stream for recovery. The vapors are commonly treated prior to discharge using granular activated carbon (GAC) or a catalytic oxidizer. SVE systems may also promote aerobic bioremediation due to the introduction of oxygen into subsurface soils.

This technology is a viable method to address soil impacted with volatile petroleum hydrocarbons in general. SVE technology was deployed at the site between 1992 and 1998 and was discontinued due to low vapor-phase recovery. SVE was dismissed as a remedial alternative during this evaluation as it only treats unsaturated zone soils and is not a standalone technology to treat saturated soil and groundwater.

## 5.2 Soil Vapor Extraction and Air Sparging

Air Sparging (AS) is a remediation technique that uses the injection of pressurized air into wells that are screened below the water table. Air bubbles travel upward and outward in the aquifer, resulting in the mass transfer of adsorbed and dissolved hydrocarbons into the vapor stream. The sparged air stream becomes hydrocarbon-laden as it travels upward toward the surface. Air sparging can also cause additional volatilization of VOCs from the vadose zone soils by providing additional air directly into the impacted interval. SVE is typically used in conjunction with AS to

remove the VOC-laden vapors from the subsurface and prevent the migration of those vapors into buildings and basements. Active remediation via SVE/AS would address both unsaturated-zone soils and saturated-zone soils.

This technology is a viable method to address soil and groundwater impacts associated with more volatile petroleum products such as gasoline. However, due to the limited water column in the overburden soils (4 to 5 feet), AS wells would have a limited radius of influence (ROI), estimated as less than 5 feet. Therefore, SVE/AS is not considered a cost-effective option for the Site based on the number of wells, infrastructure, and trenching that would be required.

## 5.3 Groundwater Recovery and Treatment

Groundwater recovery is a remedial technique that involves the pumping of groundwater using one or more recovery wells and subsequent treatment of the water in an above-ground treatment system. This remedial technique is typically used to provide hydraulic control of a dissolved-phase plume. Groundwater recovery and treatment is typically not considered to be an effective remedial technique for vadose zone impacts. In addition, soil impacts are still present in the vicinity of groundwater recovery wells which have been operational at the site since 1991. Based on the asymptotic mass removal rates from the existing groundwater recovery and treatment system, this technology was dismissed as a viable remedial alternative.

## 5.4 In-Situ Chemical Oxidation (ISCO)

Hydrocarbon constituents dissolved in groundwater and adsorbed to the soil below the water table may be treated by chemical oxidation including use of the following chemical additives: hydrogen peroxide, ozone, persulfate, and/or ORC®. These chemical oxidizers can be introduced to the subsurface via injection and react with hydrocarbon impacts to break them down into non-toxic compounds. The process differs from bioremediation techniques in that a chemical reaction is responsible for the breakdown of compounds instead of the respiration of indigenous microorganisms. By removing the reliance upon microorganisms to degrade hydrocarbons, the only limiting factor is the effective distribution of the chemical additives. The oxidizers may be injected with compressed air to widen the distribution of injected material, thereby forcing chemical additives to react throughout more of the petroleum-impacted area.

In general, chemical injection locations are determined based upon the area of impact and an anticipated radius of influence of each injection point. Thus, chemical additives may be less practical and less cost-effective at sites with tight formations that would require more closely spaced injection points. The size of the petroleum-impacted area, the availability of access to the petroleum-impacted area, and the proximity of the sensitive receptors may limit the feasibility of chemical additives as a remedial measure.

In-situ chemical oxidation was dismissed as a viable remedial option for this Site based on the suspected residual LNAPL present near monitoring well MW-1. This mass will exert a large oxidant demand, requiring high volumes of oxidant and multiple injection events to achieve suitable Site clean-up goals. In addition to the significant hydrocarbon mass near MW-1, the

limited saturated thickness of the overburden which will limit the ISCO ROI and result in smaller spacing between injection wells. The layered/heterogeneous nature of the glacial till overburden would also be expected to limit consistent radial distribution of chemical from each injection point.

### 5.5 Soil Excavation

Excavation is a common technique utilized for removal of adsorbed-phase contaminants where source soils are accessible, and the water table is sufficiently deep. Excavation provides for the immediate removal of adsorbed-phase contaminants from the subsurface and has a short remediation life cycle compared to other in-situ/ex-situ remedial treatment technologies. Excavation is not affected by dense soils or complex surficial geology that limits the effectiveness of in-situ remedial technologies. The cost for implementation of excavation may be affected by numerous site factors including subsurface and above-grade infrastructure, depth and location of adsorbed-phase hydrocarbon impact, and depth of the water table. Issues related to one or any combination of these factors may require advanced engineering controls (e.g. shoring, dewatering) or a combination of remedial technologies (e.g. ex-situ treatment of excavated soil prior to reuse as backfill), which would increase total remedial costs. Factors that prevent physical access to the source soils may render this technology infeasible.

The extents of the remedial target areas at the Site are well-defined and accessible, and as such the conditions are well suited to excavation. Due the soil characteristics, in consideration of the target remedial depth and the thickness of the saturated soil, GES anticipates shoring will be needed to stabilize the excavation sidewalls and dewatering will be required to keep the excavation relatively dry. Although overall excavation costs may be higher than other remedial options, excavation directly removes the contaminants and provides a more reliable outcome.

### 5.6 Selected Remedial Approach

Soil excavation was selected as the recommended remedial approach. This approach was selected because the extent of soil impacts is well defined and easily accessible using standard construction equipment. Soil excavation will meet the previously stated remedial goals.

## 6 Remedial Action Plan

In preparation for remediation, data from 45 soil borings advanced during the period 2019-2022 in and around the former UST areas were used to define the release area and determine the horizontal and vertical extent of soil exceeding RSR criteria (the “target area”). Details of the subsurface investigations completed between 2019 and 2022 are summarized in three subsurface investigation reports:

- *Environmental Subsurface Investigation* prepared by Weston & Sampson, February 27, 2020
- *Supplemental Subsurface Investigation Report* prepared by GES, July 2, 2021
- *Supplemental Subsurface Investigation Report* prepared by GES, April 5, 2022

Findings of the subsurface investigations completed between 2019 and 2022 indicated that petroleum-impacts in soil are generally constrained to the interval between the seasonal high water table and the bedrock surface in areas surrounding and downgradient from the former USTs C3, D4 and E5. Soil impacted with VOCs at concentrations that exceed the numeric GA Pollutant Mobility Criteria (PMC) was identified in 11 soil samples collected within the smear zone. A release area map depicting soil borings advanced at the site between 2019 and 2022, and the extent of the release area is included as **Figure 3**.

### 6.1 Excavation

Soil will be excavated from two target areas, excavation areas A and B, which measure approximately 3,500 and 500 square feet, respectively and detailed on the Proposed Excavation Map as **Figure 4**. In excavation area A, the top 10 feet of soil will be excavated and stockpiled for later reuse as backfill within the excavation area in compliance with RSRs. Soil between 10 fbg and top of bedrock (approximately 15 fbg) will be excavated for off-site disposal. Approximately 1,000 tons of petroleum-impacted soil will be excavated from area A for off-site disposal. In excavation area B, the top 12 feet of soil will be excavated and stockpiled for later reuse as backfill within the excavation area in compliance with RSRs. Soil between 12 fbg and top of bedrock (approximately 15 fbg) will be excavated for off-site disposal. Approximately 75 tons of petroleum-impacted soil will be excavated from area B for off-site disposal. Excavated petroleum-impacted soil from excavation areas A and B will be direct-loaded onto trucks to the extent possible and transported to a licensed soil recycling/disposal facility. Confirmatory soil and groundwater samples will be collected from each excavation and submitted for laboratory analysis to document post-excavation conditions.

### 6.2 Dewatering

Based on the average depth to groundwater of approximately 9.5 fbg in the area of Excavation A, approximately 12.5 fbg in the area of Excavation B, and target excavation depths of approximately 15 fbg, dewatering will be required during excavation activities. During excavation activities, a dewatering well will be established within the excavation area(s) and groundwater will be pumped to an onsite fractionation tank(s) for temporary storage. Groundwater will either be transported offsite to an approved recycling facility or treated and discharged under a CTDEEP General Permit for the Discharge of Groundwater Remediation Wastewater. If discharged onsite under an approved permit, groundwater will be pumped from the fractionation tank through a dewatering treatment system designed to capture sediment and dissolved phase hydrocarbons present in the groundwater prior to discharge.

## 7 Public Notification

Public notice of remediation was issued in accordance with Section 22a-133k-1(d) of the Regulations of Connecticut State Agencies. Documentation of public notice, including copies of the Notice of Site Remediation was mailed to each of the abutters, the Town of Madison Health Department and First Selectwoman, the CTDEEP Commissioner on September 28, 2022, and a

copy of the Notice of Site Remediation was posted to the local newspaper, The New Haven Register, on September 30, 2022. Documentation of the Public notice of remediation is included in **Appendix A**.

## PUBLIC NOTICES

### LEGAL NOTICE

Anyone knowing the whereabouts of the heirs or successors of Jane Weaver who resided at 11235 US Hwy. 431 South, Dunmor, KY, who died on May 19, 2022, please contact me at 270-338-5944 or jbattomey@att.net.

**NEW HAVEN CITY PLAN COMMISSION SPECIAL MEETING** Thursday. October 6, 2022 @ 6:00 pm. The meeting will be held via the Zoom Platform. All application materials and meeting link can be found at https://cityplancommission.newhavenct.gov Testimony will be accepted at City Plan Dept (203-946-6377). For disability accommodation, call 5 business days in advance of the hearing date: 203-946-7833 (voice) or 203-946-8582 (TTY).

### NOTICE OF SITE REMEDIAL ACTION

Pursuant to Regulations of Connecticut State Agencies (RCSA) Section 22a-133k-1(d)(1), Connecticut Light and Power Company dba Eversource Energy having an address of 107 Selden Street, Berlin Connecticut 06037, hereby gives public notice of intent to undertake remediation at 135 New Road, Madison, Connecticut (LUST ID #31668) pursuant to RCSA 22a-133k-1 through 3. The planned remediation includes excavation of petroleum-impacted soil associated with a historical release from underground storage tanks. Remediation is currently anticipated to begin February 2023 and be completed by the end of October 2023. Interested persons may obtain a copy of the remedial action plan and/or provide comments to the proposed activities by contacting Timothy S. Burke, LEP, Groundwater & Environmental Services, Inc., 100 Sebethe Drive, Suite 8 Cromwell, CT 06416 (800-220-6119 extension 3534, tburke@gesonline.com). Public comments on the remedial action plan may be submitted in writing or via electronic mail, within 30 days of publication of this notice.

### PUBLIC NOTICE

Verizon Wireless proposes to collocate wireless communications antennas at a centerline height of 75 feet on an existing 81-foot telecommunications tower at the approx. vicinity of 100 Pond Lily Avenue, New Haven, CT 06515. Public comments regarding potential effects from this site on historic properties may be submitted within 30 days from the date of this publication to: Trileaf Corp, Kristen Greaney, k.greaney@trileaf.com, 8600 LaSalle Road, Towson, MD 21286, (410) 853-7128.

## PUBLIC NOTICES

### INVITATION TO BID

**NOTICE** is hereby given that The Connecticut Association for the Performing Arts will accept General Contract bids for Repointing of the Shubert Theatre, 247 College Street, New Haven Ct. according to Contract Documents prepared by Russell and Dawson INC.

**CONTRACT DOCUMENTS** may be examined in person at:

1. OFFICE OF THE ARCHITECT
Russell and Dawson INC
1111 Main Street
East Hartford, Connecticut 06108
Ph # 860-289-1100

## GOREN BRIDGE

WITH BOB JONES

©2022 Tribune Content Agency, LLC

### NOT THE FIRST THING

Both vulnerable, South deals

NORTH
♠ A J 3
♡ 10 8 7
◇ J 6 4
♣ 9 8 4 2

WEST
♠ 5
♡ K 5 4 3
◇ Q 9 8 3 2
♣ K Q 10

EAST
♠ K 6
♡ J 9 6 2
◇ K 10 7 5
♣ J 7 5

SOUTH
♠ Q 10 9 8 7 4 2
♡ A Q
◇ A
♣ A 6 3

The bidding:

| SOUTH | WEST | NORTH | EAST |
|---|---|---|---|
| 1♠ | Pass | 2♠ | Pass |
| 4♠ | All pass | | |

Opening lead: King of ♣

South liked his contract. There were two club losers, but a successful finesse in either major suit would bring the contract home.

South held up his ace of clubs at trick one, allowing the king to hold. Should West be able to continue clubs and give East a club ruff, that was OK with South. He would still have the ace of clubs and one enemy trump would have been accounted for. West, however, shifted to a low diamond. Low from dummy, 10 from East, and the ace from South.

Before starting to take his finesses, South cashed the ace of clubs and led another club. To his surprise and delight, the clubs split 3-3. South ruffed the diamond continuation by West and led a spade to dummy's ace. Had the spades split 3-0, South would have taken the heart finesse. When both opponents followed to the ace of spades, declarer discarded his queen of hearts on dummy's nine of clubs. No finesses, making four!

Had West unblocked his queen of clubs under the ace, allowing East to win the third club and shift to a heart, South would have spurned the heart finesse and won with his ace. All he would need at that point was a 2-1 spade split, and that was more likely than taking the two finesses.

**Re: Notice of Site Remediation**
Eversource Madison Area Work Center
135 New Road
Madison, CT 06443
CTDEEP LUST ID#31668

To whom it may concern:

On behalf of Connecticut Light and Power Company dba Eversource Energy (Eversource), Groundwater and Environmental Services, Inc. (GES) hereby gives notice that Eversource will conduct soil remediation at its Madison Area Work Center located at 135 New Road, Madison, CT.

In accordance with Connecticut's *Remediation Standard Regulations*, abutting property owners must be notified prior to the implementation of site remediation activities. As the owner listed for the property located at 6 Fairfield Place, you are hereby notified that excavation of petroleum-impacted soil associated with a historical release from underground storage tanks will be conducted at the Madison Area Work Center. Remediation is currently anticipated to begin February 2023 and be completed by the end of October 2023.

Questions and comments regarding the planned remedial action may be directed within 30 days of the receipt of this letter to Mr. Timothy S. Burke, LEP, Groundwater & Environmental Services, Inc., 100 Sebethe Drive, Suite 8 Cromwell, CT 06416 (800-220-6119 extension 3534, tburke@gesonline.com).

Sincerely,

**GROUNDWATER & ENVIRONMENTAL SERVICES, INC.**

Timothy S. Burke, LEP
Principal Geologist

In accordance with Connecticut's *Remediation Standard Regulations*, abutting property owners must be notified prior to the implementation of site remediation activities. As the owner listed for the property located at 28 Fairfield Place, you are hereby notified that excavation of petroleum-impacted soil associated with a historical release from underground storage tanks will be conducted at the Madison Area Work Center. Remediation is currently anticipated to begin February 2023 and be completed by the end of October 2023.

Questions and comments regarding the planned remedial action may be directed within 30 days of the receipt of this letter to Mr. Timothy S. Burke, LEP, Groundwater & Environmental Services, Inc., 100 Sebethe Drive, Suite 8 Cromwell, CT 06416 (800-220-6119 extension 3534, tburke@gesonline.com).

Sincerely,

**GROUNDWATER & ENVIRONMENTAL SERVICES, INC.**

Timothy S. Burke, LEP
Principal Geologist

**Re: Notice of Site Remediation**
Eversource Madison Area Work Center
135 New Road
Madison, CT 06443
CTDEEP LUST ID#31668

To whom it may concern:

On behalf of Connecticut Light and Power Company dba Eversource Energy (Eversource), Groundwater and Environmental Services, Inc. (GES) hereby gives notice that Eversource will conduct soil remediation at its Madison Area Work Center located at 135 New Road, Madison, CT.

In accordance with Connecticut's *Remediation Standard Regulations*, abutting property owners must be notified prior to the implementation of site remediation activities. As the owner listed for the parcels identified as map/block 60/10 and 60/11 located on Duck Hole Road in Madison, CT, and the property located at 155 New Road in Madison, CT you are hereby notified that excavation of petroleum-impacted soil associated with a historical release from underground storage tanks will be conducted at the Madison Area Work Center. Remediation is currently anticipated to begin February 2023 and be completed by the end of October 2023.

Questions and comments regarding the planned remedial action may be directed within 30 days of the receipt of this letter to Mr. Timothy S. Burke, LEP, Groundwater & Environmental Services, Inc., 100 Sebethe Drive, Suite 8 Cromwell, CT 06416 (800-220-6119 extension 3534, tburke@gesonline.com).

Sincerely,

**GROUNDWATER & ENVIRONMENTAL SERVICES, INC.**

Timothy S. Burke, LEP
Principal Geologist

**Re: Notice of Site Remediation**
Eversource Madison Area Work Center
135 New Road
Madison, CT 06443
CTDEEP LUST ID#31668

Ms. Lyons:

On behalf of Connecticut Light and Power Company dba Eversource Energy (Eversource), Groundwater and Environmental Services, Inc. (GES) hereby gives notice that Eversource will conduct soil remediation at its Madison Area Work Center located at 135 New Road, Madison, Connecticut. This notice is being provided in compliance with Section 22a-133k-1(d) of the Regulations of Connecticut State Agencies.

The remediation, consisting of excavation of petroleum-impacted soil associated with a historical release from underground storage tanks, will be conducted at the Madison Area Work Center. Remediation is currently anticipated to begin February 2023 and be completed by the end of October 2023.

Questions and comments regarding the planned remedial action may be directed within 30 days of the receipt of this letter to Mr. Timothy S. Burke, LEP, Groundwater & Environmental Services, Inc., 100 Sebethe Drive, Suite 8 Cromwell, CT 06416 (800-220-6119 extension 3534, tburke@gesonline.com).

Sincerely,

**GROUNDWATER & ENVIRONMENTAL SERVICES, INC.**

Timothy S. Burke
